Multi-Format Karaoke Machine(DCU-2017/8)

*As technology advances, all A/V electronic products go smart, go digital. So, should karaoke machines! The 5" Disc, as a storage device to play karaoke songs, is obsolete. We therefore have to develop a new model that you may call it a **Machine of the Future**.*

*The Disc format has come to an end as the storage capacity increases in digital media, like Universal Serial Bus (USB) and the Hard Drive. The storage capacity of a Disc is about 4.7 GB and only 14 CD+G songs can be compressed therein. If a machine can play a Hard Drive of 2TB, it can store up to 250,000 MP3+G (digitalized CD+G). If a machine can play an SD card of 128 GB, it can store up to approx. 16,000 MP3+G. For most of our customers and DJ's, they do need a library of huge quantity of songs. This machine supports **2TB Hard Drive and 128 GB SD Card**.*

*Where can you source your music and store in your storage device (Hard Drive, SD Card or USB)? **Ripping and Downloading** ! If you have CD+G discs, you can still play them in this machine but better still, rip them all and store them in your storage device and then, put your discs aside in a safe place. You may also borrow all the discs from your friends and rip them all into your storage device and after that, of course, return the discs to them.*

*What about the new releases, your favorite songs or songs of different languages NOT available on any discs? Source them from the Internet! All these songs, MP3+G or MTV, can be downloaded and saved in your storage device. However, downloaded songs from the Internet are in different digital formats. This machine is therefore specially designed to **read most of the formats**.*
